## Regional Data Center Collaborative In-Person Small Group Breakouts

### Draft Recommendations for Governance

#### Regional Entity Governance

- The national network should be made up of regional entities with multi-stakeholder, nonprofit governance.
- Data sharing (between regional members? With stakeholders within their regions?) should be a condition of participation in the network.
- The state and/or community should be closely involved with each regional entity.

#### National Network Governance

- The national governing body should be established by ONC
- The multistakeholder governance structure should have a purchaser and consumer majority and include regional private and nonprofit representatives
- The governing body should have “deeming authority”, e.g. the ability to determine whether a participating entity is in compliance with standards, for example, for:
  - Data use
  - Data quality parameters
  - Interoperability
  - NPI – Identity management
  - Provider identity management
- The paradigm for the network should be a patient centered data set, possibly a patient centered data home
